SUMMARY

Frontend-focused fullstack engineer with 4+ years shipping production React systems at scale. Currently own frontend architecture for the reporting and supply-chain modules of an enterprise carbon-accounting platform, where emissions data has to survive regulator audit. Depth in Nx monorepos, schema-driven forms, frontend performance, and end-to-end delivery across React and Java services. Comfortable owning a domain from architecture decision through release.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript (ES2022+), Java, Python, HTML5, CSS3, SCSS

Frontend: React, Next.js (App Router, React Server Components, ISR), Redux Toolkit, RTK Query, Tailwind, Storybook, Vite, Webpack

Architecture: Nx monorepos, module boundaries, design systems, architecture decision records, schema-driven UI (Zod, jsonLogic)

Performance: Code splitting, tree shaking, bundle analysis, lazy loading, Core Web Vitals, profiling

Testing: Playwright (Page Object Model, fixtures, API mocking), Jest, unit and end-to-end testing

Backend and Data: Node.js, NestJS, GraphQL, REST APIs, Java services, XBRL / XML, MongoDB

DevOps and Tooling: CI/CD (Jenkins, CircleCI), Docker, AWS, Azure, Git, structured logging (Pino)

EXPERIENCE

Sprih — Member of Technical Staff (Frontend / Fullstack Engineer)

Nov 2025 – Present

Climate-tech SaaS. Enterprise carbon accounting and statutory ESG disclosure. ~35-person engineering org, 10+ enterprise customers.

- Own frontend architecture and delivery for the Reports and Supply Chain modules of an Nx React monorepo, covering scope 1/2/3 emissions reporting, facility- and source-level permission models, and supplier analytics.
- Architected and shipped statutory BRSR disclosure export end to end across the React frontend and Java backend, replacing a hand-maintained in-house XBRL emitter with a pipeline that drives the regulator's own 55-sheet validation utility headlessly — guaranteeing filing acceptance. Spans 1,840 taxonomy elements, 95 verified cell mappings, and 185 dependency rules.
- Authored the architecture and decision records for a new public ESG discovery site (Next.js 15 App Router, React Server Components, ISR with HMAC webhook revalidation and tag-based invalidation), including the cross-team contracts with backend, ops, and infrastructure before build.
- Broke a 7 MB monolithic main bundle into vendor and route-level chunks by eliminating circular barrel re-exports that blocked Rollup chunking, adding a manual chunking strategy, and lazy-loading heavy views — reducing the main chunk to KB-scale with the remainder loaded on demand.
- Set the Playwright end-to-end testing standard for the codebase, replacing a manual-aggregation JavaScript pattern with a typed Page Object Model plus reusable flows and fixtures; now the required pattern for all new modules.
- Refactored dynamic form and reporting systems around reusable hooks and schema-driven validation, and eliminated a class of site-wide date defects by consolidating scattered date handling into a tested shared utility.
- Mentor junior engineers on the frontend team through code review, architecture walkthroughs, and pairing on monorepo module boundaries.

Bluepineapple — Senior Cloud Analyst (Frontend Engineer)

Jan 2022 – Oct 2025

High-traffic consumer marketplace on Next.js + GraphQL. ~55-person engineering org, 1–2M users per day.

- Delivered features across a Next.js application backed by GraphQL APIs over WordPress and Node.js services, serving 1–2 million users daily.
- Cut average backend request time by 17% by profiling with Clinic.js and load-testing with k6.
- Authored the shared ESLint base configuration for a monorepo split, establishing naming and type-definition conventions across the newly separated content and marketplace applications.
- Improved page load performance through lazy loading and dynamic imports; built the Compare Bucket feature and optimized lead submission flows.
- Raised engineering standards through reusable components, lint rules, and expanded test coverage; contributed to the platform's Next.js upgrade and independent release-cadence work (Yarn Berry v4, Terraform, CircleCI).
- Mentored junior developers on the frontend team, onboarding them to the codebase and reviewing their pull requests.
- Partnered with Product, QA, and DevOps across a distributed team to ship production releases on a fixed cadence.

PROJECTS

CashCove — cashcove.app | github.com/AtharvaCM/cash-cove

- Own the product direction, architecture, and code review for a personal-finance SaaS running in production — pnpm and Turborepo monorepo, React + TypeScript + Vite, Redux Toolkit and RTK Query, Supabase (Postgres, Auth, Edge Functions), and Netlify scheduled functions.
- Designed a multi-channel capture pipeline (CSV, text-based PDF statements, forwarded bank email, Telegram, and an Android companion app) that lands every input as a reviewable draft with full provenance rather than posting straight to the ledger, with confidence scoring and reusable merchant-mapping rules to improve parse quality over time.
- Built privacy controls in from the start: self-serve GDPR / DPDP data export and account deletion, plus a scheduled purge that drops raw captured message text after a retention window while preserving redacted previews and provenance records.
- Shipped the Android capture companion using a native SMS receiver, WorkManager background submission, and Keystore-backed encrypted session storage.

Growthstats — growthstats.io

- Built a Next.js and Sanity CMS platform with a dynamic page builder and blog system.
- Implemented incremental static regeneration with webhook revalidation, removing manual redeployments from the content publishing loop.
- Integrated analytics (GTM, GA) and automated CI/CD pipelines.

EDUCATION

MSc Computer Science — Savitribai Phule Pune University

CGPA 9.93 | 2020 – 2022

BSc Computer Science — Savitribai Phule Pune University

82.6% | 2017 – 2020

CERTIFICATIONS

AWS Cloud Foundations | Microsoft Azure Fundamentals
